

# 7

# THE NERVOUS SYSTEM

The nervous system is the master coordinating system of the body. Every thought, action, and sensation reflects its activity. The structures of the nervous system are described in terms of two principal divisions—the central nervous system (CNS) and the peripheral nervous system (PNS). The CNS (brain and spinal cord) interprets incoming sensory information and issues instructions based on past experience. The PNS (cranial and spinal nerves and ganglia) provides the communication lines between the CNS and the body's muscles, glands, and sensory receptors. The nervous system is also divided functionally in terms of motor activities into the somatic and autonomic divisions. It is important, however, to recognize that these classifications are made for the sake of convenience and that the nervous system acts in an integrated manner both structurally and functionally.

Student activities provided in this chapter review neuron anatomy and physiology, identify the various structures of the central and peripheral nervous system, consider reflex and sensory physiology, and summarize autonomic nervous system anatomy and physiology. Because every body system is controlled, at least in part, by the nervous system, these understandings are extremely important to understanding how the body functions as a whole.

1. List the three major functions of the nervous system.

1. \_\_\_\_\_

\_\_\_\_\_

2. \_\_\_\_\_

\_\_\_\_\_

3. \_\_\_\_\_

5. Able to divide; therefore are responsible for most brain neoplasms \_\_\_\_\_

4. Are amitotic \_\_\_\_\_

3. Release neurotransmitters \_\_\_\_\_

2. Demonstrate irritability and conductivity, and thus transmit electrical messages from one area of the body to another area \_\_\_\_\_

1. Support, insulate, and protect cells \_\_\_\_\_

A. Neurons      B. Neuroglia \_\_\_\_\_

#### *Key Choices*

the appropriate letter or term in the answer blanks.

Indicate which cell type is identified by the following descriptions. Insert \_\_\_\_\_

3. This exercise emphasizes the difference between neurons and neuroglia.

## **NERVOUS TISSUE—STRUCTURE AND FUNCTION**

6. A major subdivision of the nervous system that serves as communication lines, linking all parts of the body to the CNS \_\_\_\_\_

5. A major subdivision of the nervous system that interprets incoming information and issues orders \_\_\_\_\_

4. Subdivision of the PNS that regulates the activity of the heart involuntarily nervous system \_\_\_\_\_

and smooth muscle, and glands; it is also called the \_\_\_\_\_

3. Nervous system subdivision that is composed of the cranial and spinal nerves and ganglia \_\_\_\_\_

2. Subdivision of the PNS that controls voluntary activities such as the activation of skeletal muscles \_\_\_\_\_

1. Nervous system subdivision that is composed of the brain and spinal cord \_\_\_\_\_

B. Central nervous system (CNS)      D. Somatic nervous system \_\_\_\_\_

A. Autonomic nervous system      C. Peripheral nervous system (PNS) \_\_\_\_\_

#### *Key Choices*

in the following statements. Insert the appropriate letter or term in the answer blanks.

2. Choose the key responses that best correspond to the descriptions provided \_\_\_\_\_

## **ORGANIZATION OF THE NERVOUS SYSTEM**

4. Relative to neuron anatomy, match the anatomical terms given in Column B with the appropriate descriptions of functions provided in Column A. Place the correct term or letter response in the answer blanks.

<b>Column A</b>	<b>Column B</b>
_____	A. Axon
_____	B. Axon terminal
_____	C. Dendrite
_____	D. Myelin sheath
_____	E. Cell body
_____	
1. Releases neurotransmitters	
2. Conducts electrical currents toward the cell body	
3. Increases the speed of impulse transmission	
4. Location of the nucleus	
5. Generally conducts impulses away from the cell body	

5. Certain activities or sensations are listed below. Using the key choices, select the specific receptor type that would be activated by the activity or sensation described. Insert the correct term(s) or letter response(s) in the answer blanks. Note that more than one receptor type may be activated in some cases.

*Key Choices*

- A. Bare nerve endings (pain)      C. Meissner's corpuscle      E. Pacinian corpuscle  
B. Golgi tendon organ      D. Muscle spindle

**Activity or Sensation**

**Receptor Type**

Walking on hot pavement

1. (Identify two) \_\_\_\_\_  
and \_\_\_\_\_

Feeling a pinch

2. (Identify two) \_\_\_\_\_  
and \_\_\_\_\_

Leaning on a shovel

3. \_\_\_\_\_

Muscle sensations when rowing a boat

4. (Identify two) \_\_\_\_\_  
and \_\_\_\_\_

Feeling a caress

5. \_\_\_\_\_

### *Key Choices*

6. Using the key choices, select the terms identified in the following descriptions by inserting the appropriate letter or term in the spaces provided.

- A. Afferent neuron
- B. Association neuron (or interneuron)
- C. Cutaneous sense organs
- D. Efferent neuron
- E. Ganglion
- F. Neuroglia
- G. Neurotransmitters
- H. Nerve
- I. Nodes of Ranvier
- J. Nuclei
- K. Proprioreceptors
- L. Schwann cells
- M. Synapse
- N. Stimuli
- O. Tract

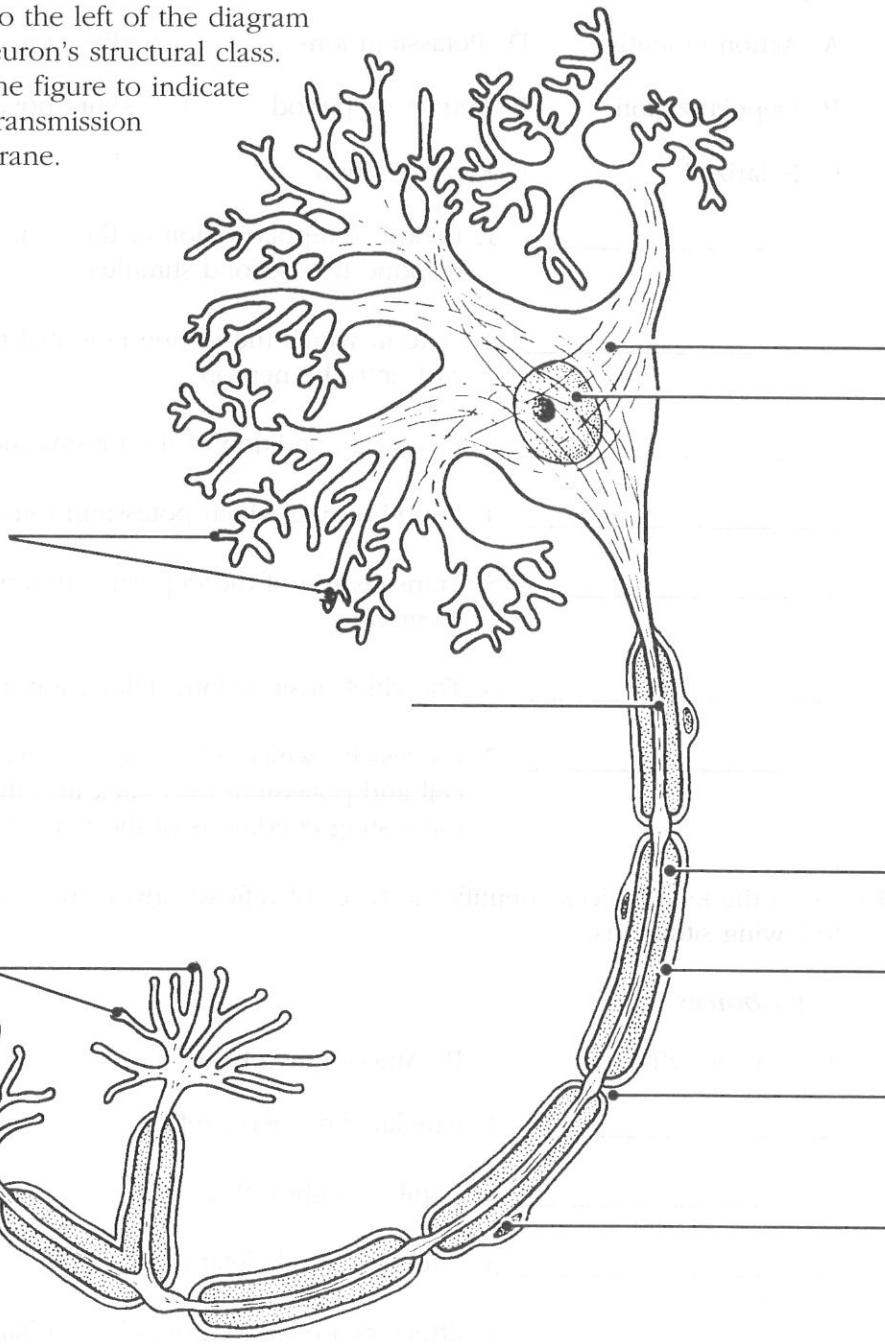

2. Specialized cells that myelinate the fibers of neurons found in the PNS

1. Sensory receptors found in the skin, which are specialized to detect temperature, pressure changes, and pain

- 3. Junction or point of close contact between neurons
- 4. Bundle of nerve processes inside the CNS
- 5. Neuron, serving as part of the conduction pathway between sensory and motor neurons
- 6. Gaps in a myelin sheath
- 7. Collection of nerve cell bodies found outside the CNS
- 8. Neuron that conducts impulses away from the CNS to muscles and glands
- 9. Sensory receptors found in muscle and tendons that detect their degree of stretch
- 10. Changes, occurring within or outside the body, that affect nervous system functioning
- 11. Neuron that conducts impulses toward the CNS from the body periphery
- 12. Chemicals released by neurons that stimulate other neurons, muscles, or glands

7. Figure 7–1 is a diagram of a neuron. First, label the parts indicated on the illustration by leader lines. Then choose different colors for each of the structures listed below and use them to color in the coding circles and corresponding structures in the illustration. Next, circle the term in the list of three terms to the left of the diagram that best describes this neuron's structural class. Finally, draw arrows on the figure to indicate the direction of impulse transmission along the neuron's membrane.

- Axon
- Dendrites
- Cell body
- Myelin sheath

**Figure 7–1**

8. List in order the *minimum* elements in a reflex arc from the stimulus to the activity of the effector. Place your responses in the answer blanks.

1. Stimulus
2. \_\_\_\_\_
3. \_\_\_\_\_
4. \_\_\_\_\_
5. Effector organ

A. Somatic reflex(es)	B. Autonomic reflex(es)
<b>Key Choices</b>	
1. Patellar (knee-jerk) reflex	2. Pupillary light reflex
3. Effectors are skeletal muscles	4. Effectors are smooth muscle and glands
5. Flexor reflex	6. Regulation of blood pressure
7. Salivary reflex	
<b>Key Choices</b>	
1. Using the key choices, identify the types of reflexes involved in each of the following situations.	10. Using the key choices, identify the types of reflexes involved in each of the following situations.
2. State in which the resting potential is reversed as sodium ions rush into the neuron	7. Process by which ATP is used to move sodium ions out of the cell and potassium ions back into the cell; completely restores the resting conditions of the neuron
3. Electrical condition of the plasma membrane of a resting neuron	6. The chief positive intracellular ion in a resting neuron
4. Period during which potassium ions diffuse out of the neuron	5. Transmission of the depolarization wave along the neuron's membrane
5. Period of repolarization of the plasma membrane of a resting neuron	7. Process by which ATP is used to move sodium ions out of the cell and potassium ions back into the cell; completely restores the resting conditions of the neuron
6. Resting condition of the plasma membrane of a resting neuron	6. The chief positive intracellular ion in a resting neuron
7. State in which the resting potential is reversed as sodium ions	5. Transmission of the depolarization wave along the neuron's membrane
8. Electrical condition of the plasma membrane of a resting neuron	4. Period during which potassium ions diffuse out of the neuron
9. Action potential	3. Electrical condition of the plasma membrane of a resting neuron
D. Potassium ions	2. State in which the resting potential is reversed as sodium ions
E. Refractory period	1. Period of repolarization of the plasma membrane of a resting neuron
F. Repolarization	7. Process by which ATP is used to move sodium ions out of the cell and potassium ions back into the cell; completely restores the resting conditions of the neuron
G. Sodium ions	6. The chief positive intracellular ion in a resting neuron
H. Sodium-potassium pump	5. Transmission of the depolarization wave along the neuron's membrane
I. Depolarization	4. Period during which potassium ions diffuse out of the neuron
J. Polarized	3. Electrical condition of the plasma membrane of a resting neuron
K. Repolarized	2. State in which the resting potential is reversed as sodium ions
L. Resting potential	1. Period of repolarization of the plasma membrane of a resting neuron
M. Potassium ions	7. Process by which ATP is used to move sodium ions out of the cell and potassium ions back into the cell; completely restores the resting conditions of the neuron
N. Sodium ions	6. The chief positive intracellular ion in a resting neuron
O. Potassium ions	5. Transmission of the depolarization wave along the neuron's membrane
P. Refractory period	4. Period during which potassium ions diffuse out of the neuron
Q. Resting potential	3. Electrical condition of the plasma membrane of a resting neuron
R. Sodium ions	2. State in which the resting potential is reversed as sodium ions
S. Potassium ions	1. Period of repolarization of the plasma membrane of a resting neuron
T. Polarized	7. Process by which ATP is used to move sodium ions out of the cell and potassium ions back into the cell; completely restores the resting conditions of the neuron
U. Repolarized	6. The chief positive intracellular ion in a resting neuron
V. Resting potential	5. Transmission of the depolarization wave along the neuron's membrane
W. Potassium ions	4. Period during which potassium ions diffuse out of the neuron
X. Sodium ions	3. Electrical condition of the plasma membrane of a resting neuron
Y. Potassium ions	2. State in which the resting potential is reversed as sodium ions
Z. Resting potential	1. Period of repolarization of the plasma membrane of a resting neuron

Place the correct term or letter response in the answer blanks.  
9. Using the key choices, identify the terms defined in the following statements.

11. Refer to Figure 7–2, showing a reflex arc, as you complete this exercise. First, briefly answer the following questions by inserting your responses in the spaces provided.

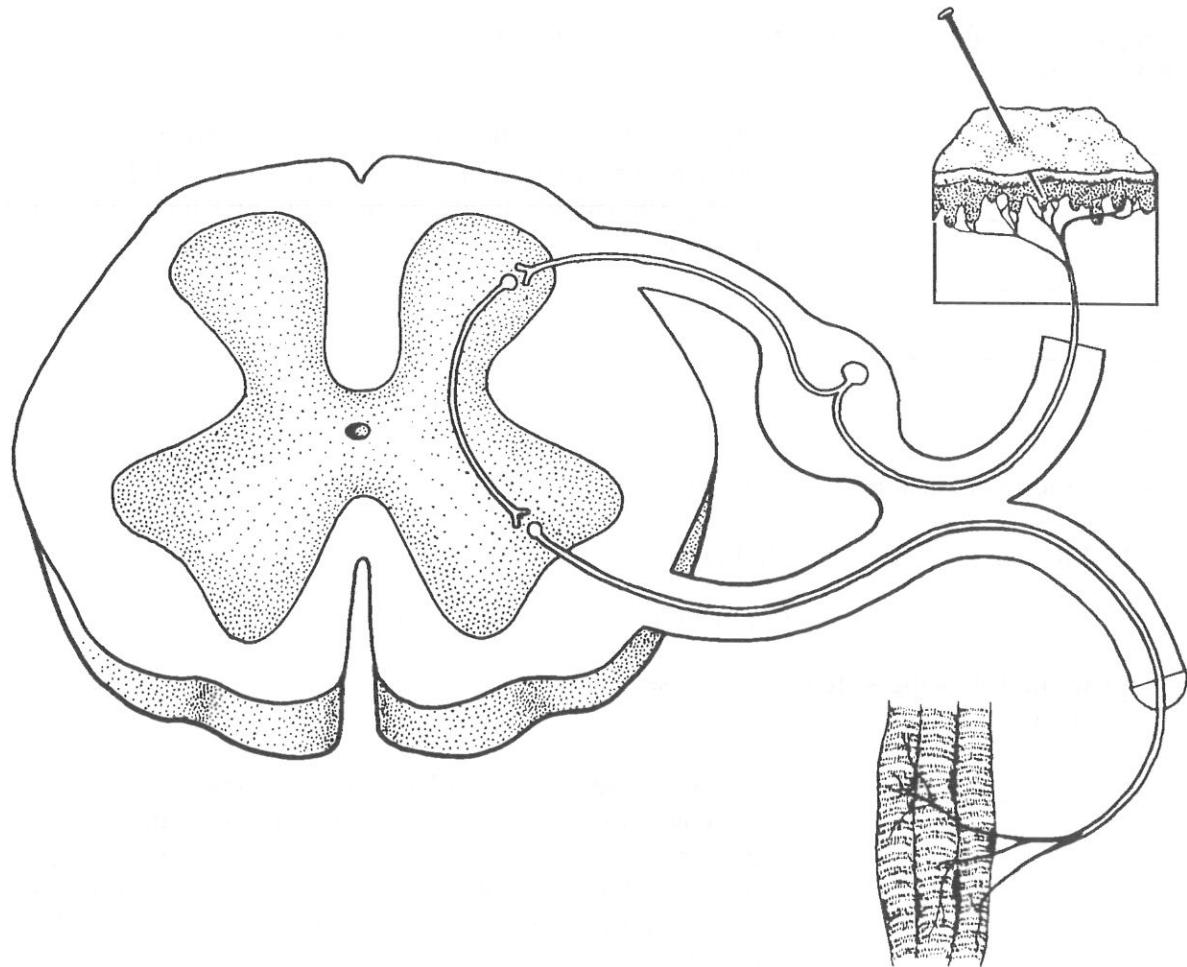

1. What is the stimulus? \_\_\_\_\_

2. What tissue is the effector? \_\_\_\_\_

3. How many synapses occur in this reflex arc? \_\_\_\_\_

Next, select different colors for each of the following structures and use them to color in the coding circles and corresponding structures in the diagram. Finally, draw arrows on the figure indicating the direction of impulse transmission through this reflex pathway.

- Receptor region
- Interneuron
- Afferent neuron
- Efferent neuron
- Effector

**Figure 7–2**

12. Circle the term that does not belong in each of the following groupings.

1. Astrocytes      Neurons      Oligodendrocytes      Microglia
2.  $K^+$  enters the cell       $K^+$  leaves the cell      Repolarization      Refractory period
3. Nodes of Ranvier      Myelin sheath      Unmyelinated      Saltatory conduction
4. Predictable response      Voluntary act      Involuntary act      Reflex
5. Oligodendrocytes      Schwann cells      Myelin      Microglia
6. Cutaneous receptors      Free dendritic endings      Stretch      Pain and touch
7. Cell interior      High  $Na^+$       Low  $Na^+$       High  $K^+$

## Brain

### CENTRAL NERVOUS SYSTEM

13. Complete the following statements by inserting your answers in the answer blanks.

1. The largest part of the human brain is the (paired) (1). The other major subdivisions of the brain are the (2) and the (3). The cavities found in the brain are called (4). They contain (5).

14. Circle the terms indicating structures that are *not* part of the brain stem.

- Pons      Cerebellum      Diencephalon  
 Cerebral hemispheres      Midbrain      Medulla

15. Complete the following statements by inserting your answers in the answer blanks.

1. A (1) is an elevated ridge of cerebral cortex tissue. The convolutions seen in the cerebrum are important because they increase the (2). Gray matter is composed of (3). White matter is composed of (4), which provide for communication between different parts of the brain as well as with lower CNS centres. The lentiform nucleus, the caudate, and other nuclei are collectively called the (5).

- 1.
- 2.
- 3.
- 4.
- 5.

16. Figure 7–3 is a diagram of the right lateral view of the human brain. First, match the letters on the diagram with the following list of terms and insert the appropriate letters in the answer blanks. Then, select different colors for each of the areas of the brain provided with a color-coding circle and use them to color in the coding circles and corresponding structures in the diagram. If an identified area is part of a lobe, use the color you selected for the lobe but use *stripes* for that area.

- |  |  |
|--|--|
| _____ 1. <input type="radio"/> Frontal lobe      | _____ 7. <input type="radio"/> Lateral sulcus  |
| _____ 2. <input type="radio"/> Parietal lobe     | _____ 8. <input type="radio"/> Central sulcus  |
| _____ 3. <input type="radio"/> Temporal lobe     | _____ 9. <input type="radio"/> Cerebellum      |
| _____ 4. <input type="radio"/> Precentral gyrus  | _____ 10. <input type="radio"/> Medulla        |
| _____ 5. Parieto-occipital fissure               | _____ 11. <input type="radio"/> Occipital lobe |
| _____ 6. <input type="radio"/> Postcentral gyrus | _____ 12. <input type="radio"/> Pons           |

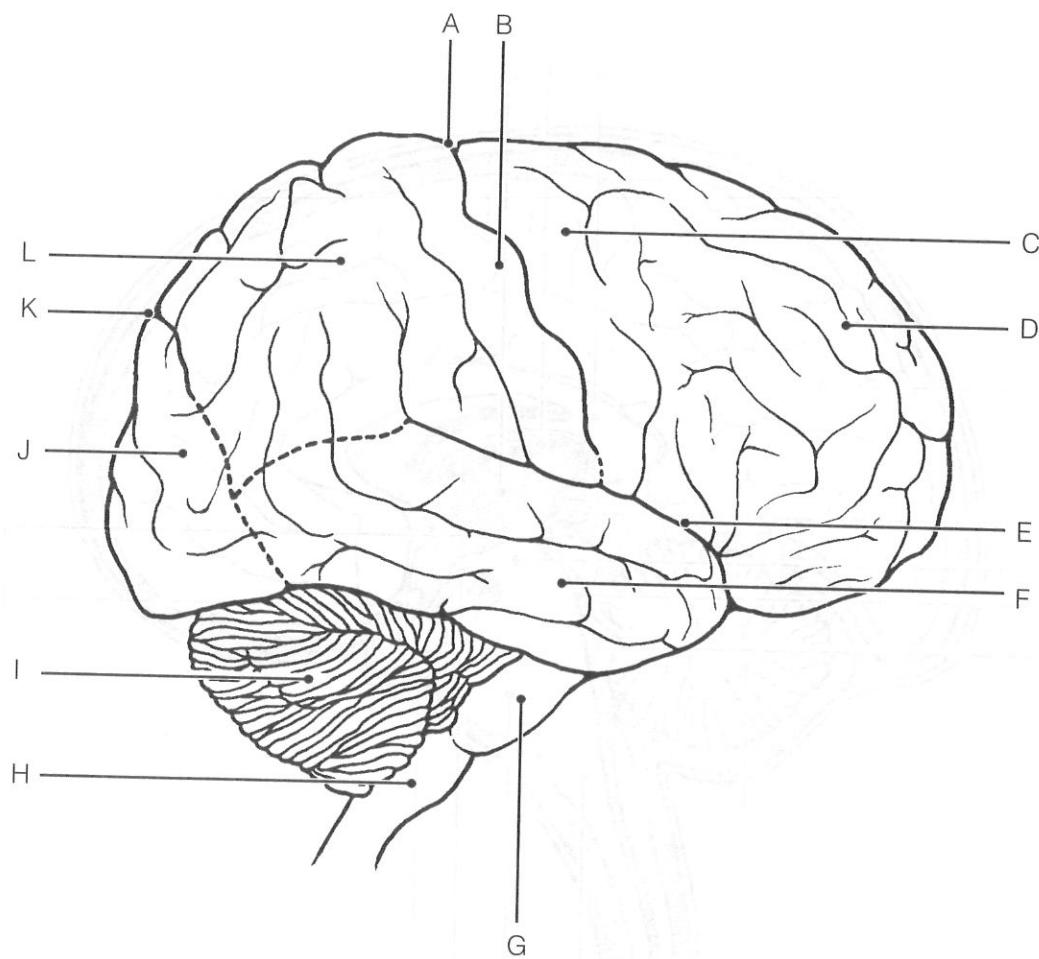

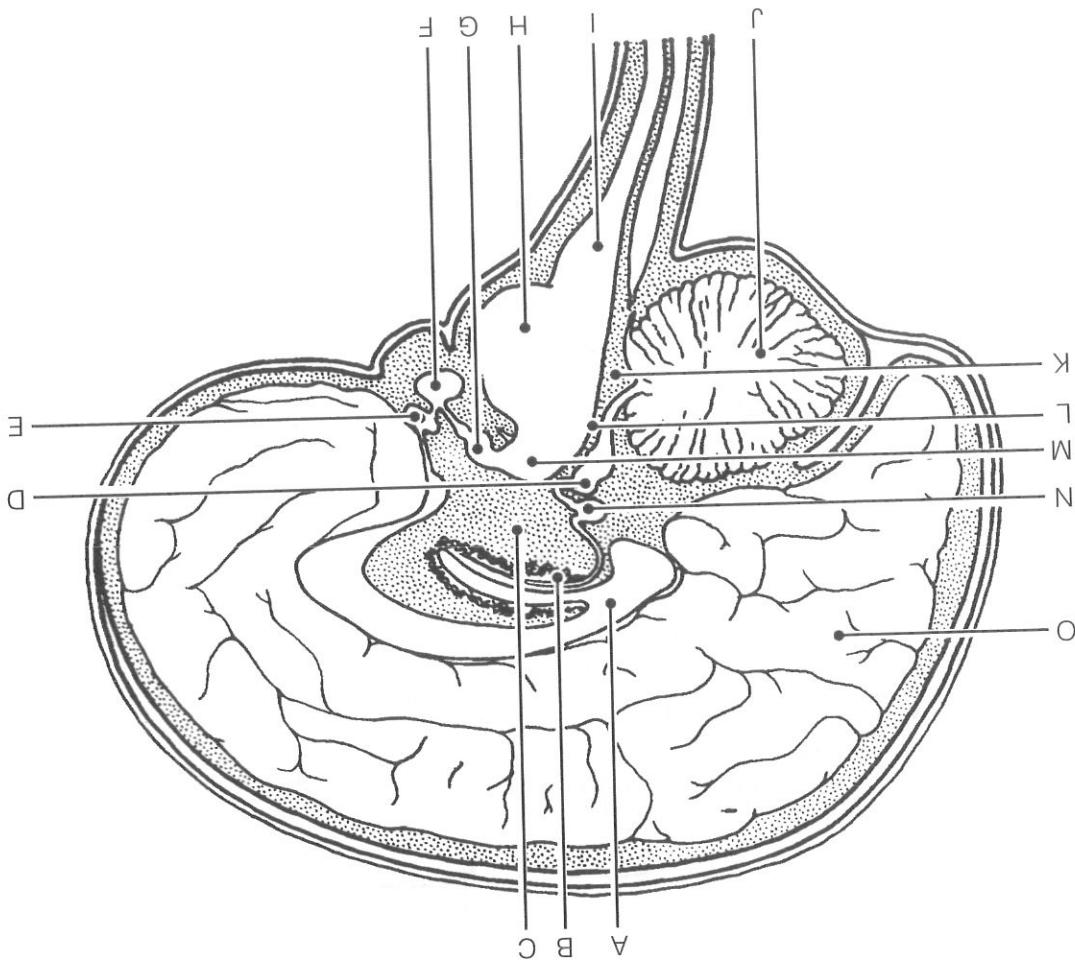

Figure 7–3

**Figure 7-4**

1. Cerebellum
2. Cerebral aqueduct
3. Cerebral hemisphere
4. Cerebral peduncle
5. Choroid plexus
6. Corpora quadrigemina
7. Corpus callosum
8. Fourth ventricle
9. Mammillary body
10. Medulla oblongata
11. Optic chiasma
12. Pineal body
13. Pituitary gland
14. Pons
15. Thalamus

17. Figure 7-4 is a diagram of the sagittal view of the human brain. First, match the letters on the diagram with the following list of terms and insert the appropriate letter in each answer blank. Then, color the brain-stem areas blue and the areas where cerebrospinal fluid is found yellow.

the letters on the diagram with the following list of terms and insert the appropriate letter in each answer blank. Then, color the brain-stem areas blue and the areas where cerebrospinal fluid is found yellow.

- 18.** Referring to the brain areas listed in Exercise 17, match the appropriate brain structures with the following descriptions. Insert the correct terms in the answer blanks.

- \_\_\_\_\_ 1. Site of regulation of water balance and body temperature
- \_\_\_\_\_ 2. Contains reflex centers involved in regulating respiratory rhythm in conjunction with lower brain-stem centers
- \_\_\_\_\_ 3. Responsible for the regulation of posture and coordination of skeletal muscle movements
- \_\_\_\_\_ 4. Important relay station for afferent fibers traveling to the sensory cortex for interpretation
- \_\_\_\_\_ 5. Contains autonomic centers, which regulate blood pressure and respiratory rhythm, as well as coughing and sneezing centers
- \_\_\_\_\_ 6. Large fiber tract connecting the cerebral hemispheres
- \_\_\_\_\_ 7. Connects the third and fourth ventricles
- \_\_\_\_\_ 8. Encloses the third ventricle
- \_\_\_\_\_ 9. Forms the cerebrospinal fluid
- \_\_\_\_\_ 10. Midbrain area that is largely fiber tracts; bulges anteriorly
- \_\_\_\_\_ 11. Part of the limbic system; contains centers for many drives (rage, pleasure, hunger, sex, etc.)

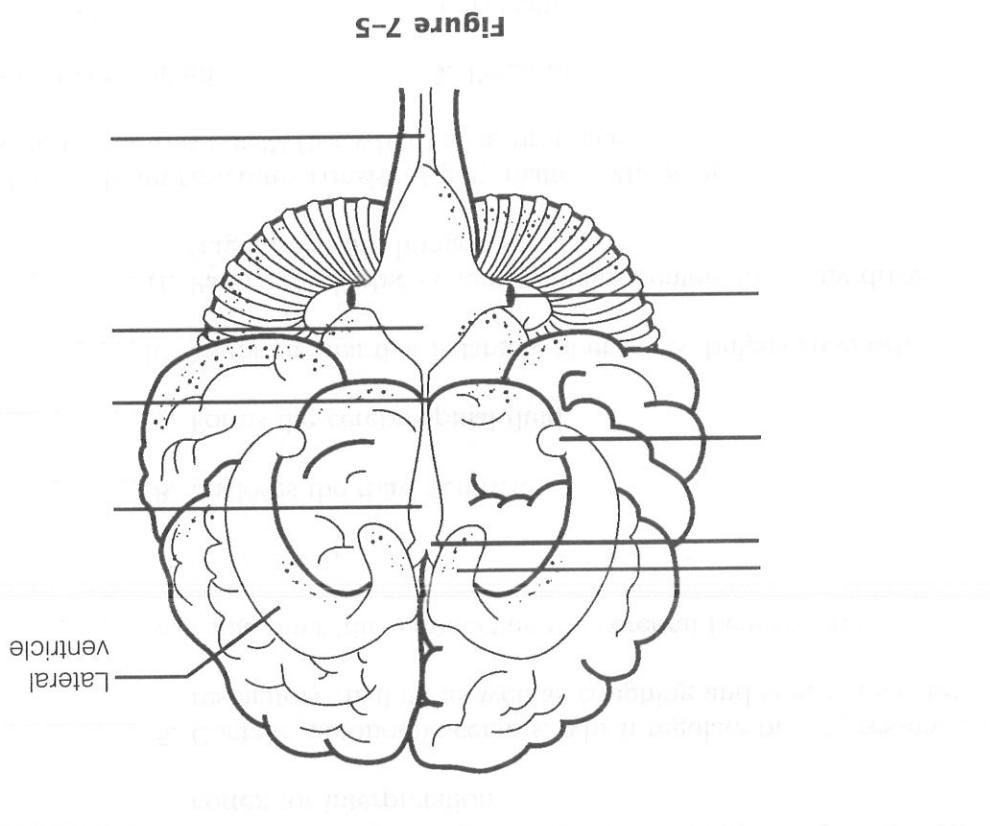

- 19.** Some of the following brain structures consist of gray matter; others are white matter. Write G (for gray) or W (for white) as appropriate.

- |                               |                              |
|-------------------------------|------------------------------|
| _____ 1. Cortex of cerebellum | _____ 5. Pyramids            |
| _____ 2. Basal nuclei         | _____ 6. Thalamic nuclei     |
| _____ 3. Anterior commissure  | _____ 7. Cerebellar peduncle |
| _____ 4. Corpus callosum      |                              |

20. Figure 7-5 illustrates a "see-through" brain showing the positioning of the ventricles and connecting canals or apertures. Correctly identify all structures having leader lines by using the key choices provided below. One of the lateral ventricles has already been identified. Color the spaces filled with cerebrospinal fluid blue.

**Key Choices**

- A. Anterior horn
- B. Central canal
- C. Cerebral aqueduct
- D. Fourth ventricle
- E. Inferior horn
- F. Interventricular foramen
- G. Lateral aperture
- H. Third ventricle

**Figure 7-5**

The following numbered items correspond to numbered leader lines in Figure 7-5.

1. Lateral ventricle  
2. Central canal  
3. Cerebral aqueduct  
4. Fourth ventricle  
5. Inferior horn  
6. Interventricular foramen  
7. Lateral aperture  
8. Third ventricle

9. Anterior horn  
10. Lateral ventricle  
11. Inferior horn  
12. Interventricular foramen  
13. Lateral aperture  
14. Third ventricle  
15. Central canal  
16. Cerebral aqueduct

17. Anterior horn  
18. Lateral ventricle  
19. Inferior horn  
20. Interventricular foramen  
21. Lateral aperture  
22. Third ventricle  
23. Central canal  
24. Cerebral aqueduct

25. Anterior horn  
26. Lateral ventricle  
27. Inferior horn  
28. Interventricular foramen  
29. Lateral aperture  
30. Third ventricle  
31. Central canal  
32. Cerebral aqueduct

33. Anterior horn  
34. Lateral ventricle  
35. Inferior horn  
36. Interventricular foramen  
37. Lateral aperture  
38. Third ventricle  
39. Central canal  
40. Cerebral aqueduct

41. Anterior horn  
42. Lateral ventricle  
43. Inferior horn  
44. Interventricular foramen  
45. Lateral aperture  
46. Third ventricle  
47. Central canal  
48. Cerebral aqueduct

49. Anterior horn  
50. Lateral ventricle  
51. Inferior horn  
52. Interventricular foramen  
53. Lateral aperture  
54. Third ventricle  
55. Central canal  
56. Cerebral aqueduct

57. Anterior horn  
58. Lateral ventricle  
59. Inferior horn  
60. Interventricular foramen  
61. Lateral aperture  
62. Third ventricle  
63. Central canal  
64. Cerebral aqueduct

65. Anterior horn  
66. Lateral ventricle  
67. Inferior horn  
68. Interventricular foramen  
69. Lateral aperture  
70. Third ventricle  
71. Central canal  
72. Cerebral aqueduct

73. Anterior horn  
74. Lateral ventricle  
75. Inferior horn  
76. Interventricular foramen  
77. Lateral aperture  
78. Third ventricle  
79. Central canal  
80. Cerebral aqueduct

82. Anterior horn  
83. Lateral ventricle  
84. Inferior horn  
85. Interventricular foramen  
86. Lateral aperture  
87. Third ventricle  
88. Central canal  
89. Cerebral aqueduct

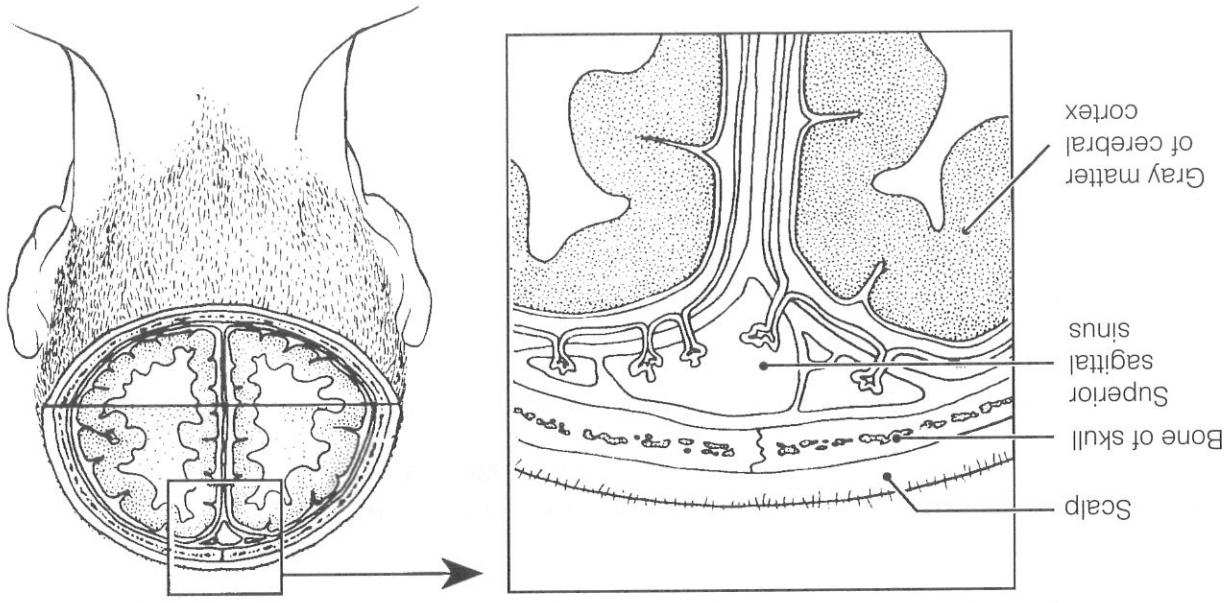

91. Anterior horn  
92. Lateral ventricle  
93. Inferior horn  
94. Interventricular foramen  
95. Lateral aperture  
96. Third ventricle  
97. Central canal  
98. Cerebral aqueduct

101. Anterior horn  
102. Lateral ventricle  
103. Inferior horn  
104. Interventricular foramen  
105. Lateral aperture  
106. Third ventricle  
107. Central canal  
108. Cerebral aqueduct

21. If a statement is true, write the letter *T* in the answer blank. If a statement is false, correct the underlined word(s) and write the correct word(s) in the answer blank.

- \_\_\_\_\_ 1. The primary somatosensory area of the cerebral hemisphere(s) is found in the precentral gyrus.
- \_\_\_\_\_ 2. Cortical areas involved in audition are found in the occipital lobe.
- \_\_\_\_\_ 3. The primary motor area in the temporal lobe is involved in the initiation of voluntary movements.
- \_\_\_\_\_ 4. The specialized motor speech area is located at the base of the precentral gyrus in an area called Wernicke's area.
- \_\_\_\_\_ 5. The right cerebral hemisphere receives sensory input from the right side of the body.
- \_\_\_\_\_ 6. The pyramidal tract is the major descending voluntary motor tract.
- \_\_\_\_\_ 7. The primary motor cortex is located in the postcentral gyrus.
- \_\_\_\_\_ 8. Centers for control of repetitious or stereotyped motor skills are found in the primary motor cortex.
- \_\_\_\_\_ 9. The largest parts of the motor humunculi are the lips, tongue, and toes.
- \_\_\_\_\_ 10. Sensations such as touch and pain are integrated in the primary sensory cortex.
- \_\_\_\_\_ 11. The primary visual cortex is in the frontal lobe of each cerebral hemisphere.
- \_\_\_\_\_ 12. In most humans, the area that controls the comprehension of language is located in the left cerebral hemisphere.
- \_\_\_\_\_ 13. A flat EEG is evidence of clinical death.
- \_\_\_\_\_ 14. Beta waves are recorded when an individual is awake and relaxed.

**Figure 7-6**

- Arachnoid mater
- Subarachnoid space
- Pia mater
- Dura mater

23. Figure 7-6 shows a frontal view of the meninges of the brain at the level of the superior sagittal (dural) sinus. First, label the *arachnoid* *vitri* on the figure. Then, select different colors for each of the following structures and use them to color the coding circles and corresponding structures in the diagram.

5. Its outer layer forms the periosteum of the skull \_\_\_\_\_
  4. Middle meningeal layer; like a cobweb in structure \_\_\_\_\_
  3. Structures that return cerebrospinal fluid to the venous blood in the dural sinuses \_\_\_\_\_
  2. Innermost covering of the brain; delicate and vascular connective tissue \_\_\_\_\_
  1. Outermost covering of the brain, composed of tough fibrous connective tissue \_\_\_\_\_
22. Identify the meningeal (or associated) structures described here.

## Protection of the CNS

- 24.** Complete the following statements by inserting your answers in the answer blanks.

- \_\_\_\_\_ 1. Cerebrospinal fluid is formed by capillary knots called (1), which hang into the (2) of the brain. Ordinarily, cerebrospinal fluid flows from the lateral ventricles to the third ventricle and then through the (3) to the fourth ventricle. Some of the fluid continues down the (4) of the spinal cord, but most of it circulates into the (5) by passing through three tiny openings in the walls of the (6). As a rule, cerebrospinal fluid is formed and drained back into the venous blood at the same rate. If its drainage is blocked, a condition called (7) occurs, which results in increased pressure on the brain.
- \_\_\_\_\_ 2.
- \_\_\_\_\_ 3.
- \_\_\_\_\_ 4.
- \_\_\_\_\_ 5.
- \_\_\_\_\_ 6.
- \_\_\_\_\_ 7.

## Brain Dysfunctions

- 25.** Match the brain disorders listed in Column B with the conditions described in Column A. Place the correct answers in the answer blanks.

<b>Column A</b>	<b>Column B</b>
_____ 1. Slight and transient brain injury	A. Alzheimer's disease
_____ 2. Traumatic injury that destroys brain tissue	B. Cerebral edema
_____ 3. Total nonresponsiveness to stimulation	C. Cerebrovascular accident (CVA)
_____ 4. May cause medulla oblongata to be wedged into foramen magnum by pressure of blood	D. Coma
_____ 5. After head injury, retention of water by brain	E. Concussion
_____ 6. Results when a brain region is deprived of blood or exposed to prolonged ischemia	F. Contusion
_____ 7. Progressive degeneration of the brain with abnormal protein deposits	G. Intracranial hemorrhage
_____ 8. Autoimmune disorder with extensive demyelination	H. Multiple sclerosis
_____ 9. A ministroke; fleeting symptoms of a CVA	I. Transient ischemic attack (TIA)

## Spinal Cord

26. Complete the following statements by inserting your responses in the answer blanks.

1. The spinal cord extends from the (1) of the skull to the (2) region of the vertebral column. The meninges, which cover the spinal cord, extend more inferiorly to form a sac from which cerebrospinal fluid can be withdrawn without damage to the spinal cord. This procedure is called a (3). (4) pairs of spinal nerves arise from the cord. Of these, (5) pairs are cervical nerves, (6) pairs are thoracic nerves, (7) pairs are lumbar nerves, and (8) pairs are sacral nerves. The tail-like collection of spinal nerves at the inferior end of the spinal cord is called the (9).

1. The spinal cord extends from the (1) of the skull to the (2) region of the vertebral column. The meninges, which cover the spinal cord, extend more inferiorly to form a sac from which cerebrospinal fluid can be withdrawn without damage to the spinal cord. This procedure is called a (3). (4) pairs of spinal nerves arise from the cord. Of these, (5) pairs are cervical nerves, (6) pairs are thoracic nerves, (7) pairs are lumbar nerves, and (8) pairs are sacral nerves. The tail-like collection of spinal nerves at the inferior end of the spinal cord is called the (9).
2. ( )

4. ( )
5. ( )
6. ( )
7. ( )
8. ( )
9. ( )

27. Using the key choices, select the appropriate terms to respond to the following descriptions referring to spinal cord anatomy. Place the correct term or letter in the answer blanks.
- Key Choices**
- A. Afferent
  - B. Efferent
  - C. Both afferent and efferent
  - D. Association neurons (interneurons)
  - 1. Neuron type found in the dorsal horn
  - 2. Neuron type found in the ventral horn
  - 3. Neuron type in a dorsal root ganglion
  - 4. Fiber type in the ventral root
  - 5. Fiber type in the dorsal root
  - 6. Fiber type in a spinal nerve
  - 7. Fiber type in the anterior ramus
  - 8. Damage to this fiber type would lead to a loss of sensory function
  - 9. Damage to this fiber type results in a loss of motor function

9. Damage to this fiber type results in a loss of motor function

1. Neuron type found in the dorsal horn
2. Neuron type found in the ventral horn
3. Neuron type in a dorsal root ganglion
4. Fiber type in the ventral root
5. Fiber type in the dorsal root
6. Fiber type in a spinal nerve
7. Fiber type in the anterior ramus
8. Damage to this fiber type would lead to a loss of sensory function
9. Damage to this fiber type results in a loss of motor function

26. Complete the following statements by inserting your responses in the answer blanks.

28. Figure 7–7 is a cross-sectional view of the spinal cord. First identify the areas listed in the key choices by inserting the correct letters next to the appropriate leader lines on parts A and B of the figure. Then, color the bones of the vertebral column in part B gold.

#### Key Choices

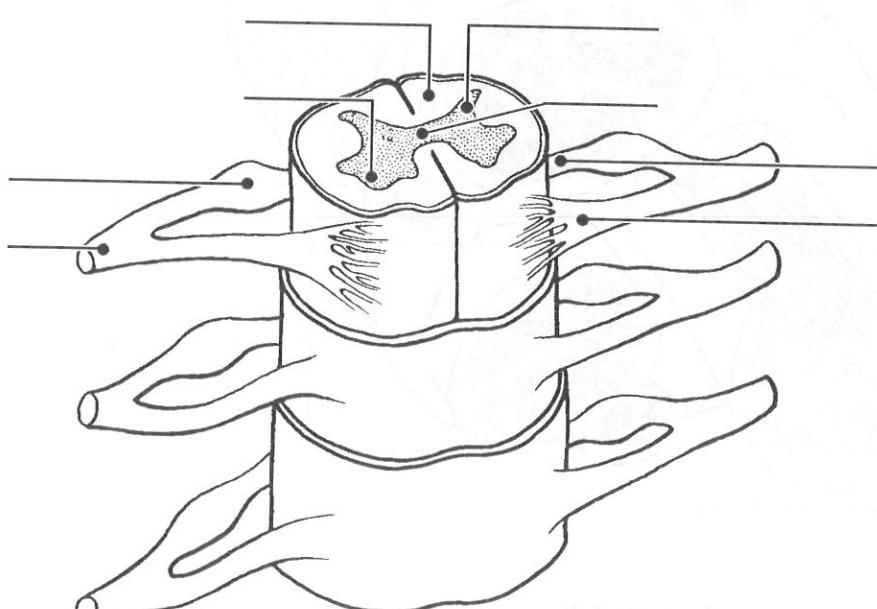

- |                            |                         |                 |
|----------------------------|-------------------------|-----------------|
| A. Central canal           | E. Dorsal root          | I. Ventral horn |
| B. Columns of white matter | F. Dorsal root ganglion | J. Ventral root |
| C. Conus medullaris        | G. Filum terminale      |                 |
| D. Dorsal horn             | H. Spinal nerve         |                 |

On part A, color the butterfly-shaped gray matter gray, and color the spinal nerves and roots yellow. Finally, select different colors to identify the following structures and use them to color the figure.

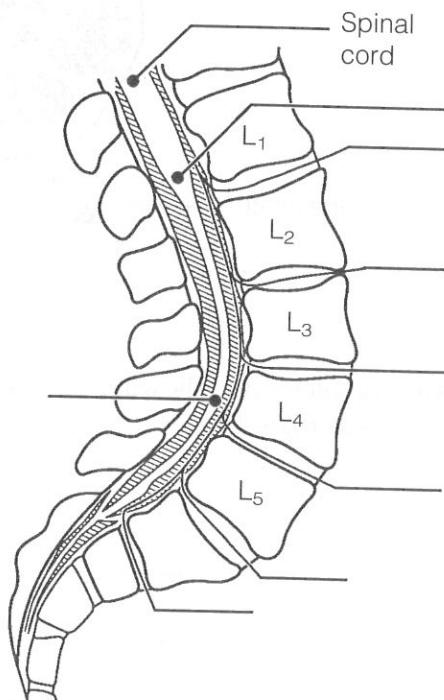

Pia mater

Dura mater

Arachnoid mater

A

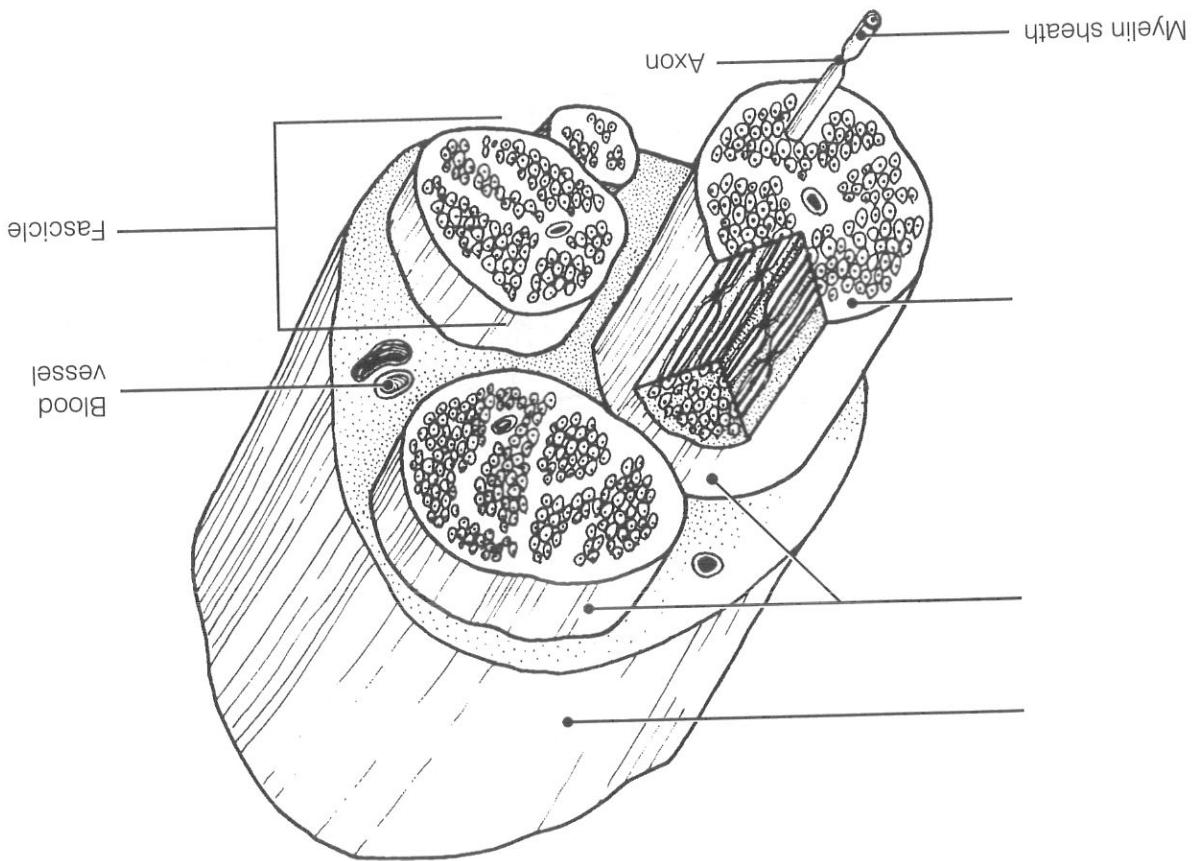

B

Figure 7-7

1. Another name for a bundle of nerve fibers is (1). Nerves carrying both sensory and motor fibers are called (2) \_\_\_\_\_ nerves, whereas those carrying just sensory fibers are referred to as sensory, or (3), nerves.

30. Complete the following statements by inserting your responses in the answer blanks.

**Figure 7-8**

- Endoneurium     Perineurium     Epineurium

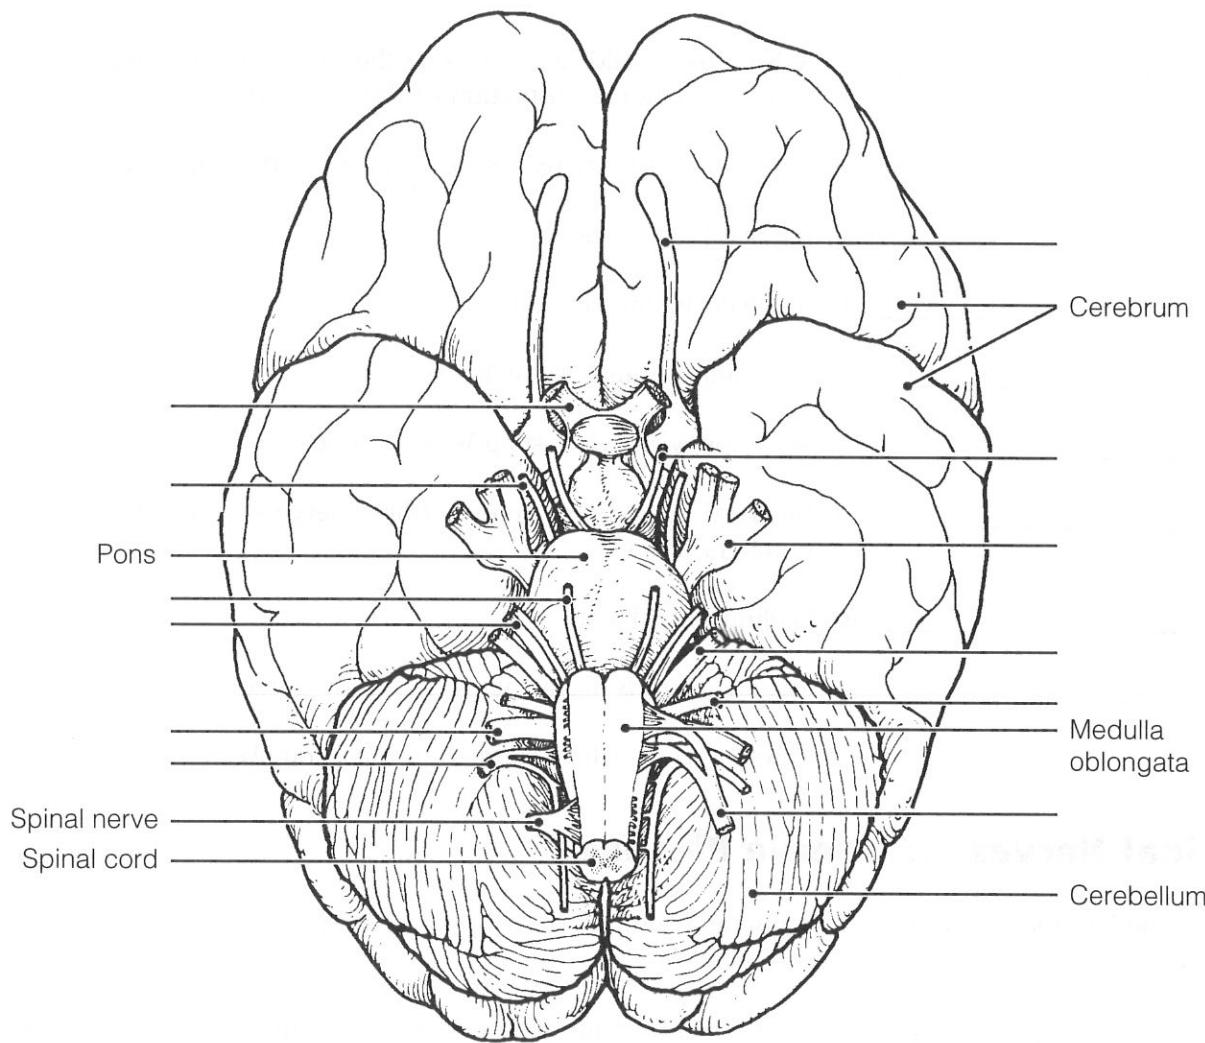

Then, label each of the sheaths indicated by leader lines on the figure. them to color the coding circles and corresponding structures in the figure. coverings. Select different colors to identify the following structures and use 29. Figure 7-8 is a diagrammatic view of a nerve wrapped in its connective tissue

## PERIPHERAL NERVOUS SYSTEM

### Structure of a Nerve

## Cranial Nerves

31. The 12 pairs of cranial nerves are indicated by leader lines in Figure 7–9. First, label each by name and Roman numeral on the figure and then color each nerve with a different color.

**Figure 7–9**

4. \_\_\_\_\_
3. serve the (4).

## Spinal Nerves and Nerve Plexuses

12. Purely sensory (three nerves—provide numbers only)  
\_\_\_\_\_

11. Reading *Tennis* magazine or this study guide  
\_\_\_\_\_

10. Feeling a toothache  
\_\_\_\_\_

9. Involved in “rolling” the eyes (three nerves—provide  
numbers only)  
\_\_\_\_\_

8. Secretion of saliva; tasting well-seasoned food  
\_\_\_\_\_

7. Listening to music; seasickness  
\_\_\_\_\_

6. Involved in chewing gum  
\_\_\_\_\_

5. Involved in smiling  
\_\_\_\_\_

4. Slows the heart; increases the mobility of the digestive tract  
\_\_\_\_\_

3. Raising the eyelids and focusing the lens of the eye for  
accommodation; constriction of the eye pupils  
\_\_\_\_\_

2. Smelling a flower  
\_\_\_\_\_

1. Shrugging the shoulders  
\_\_\_\_\_

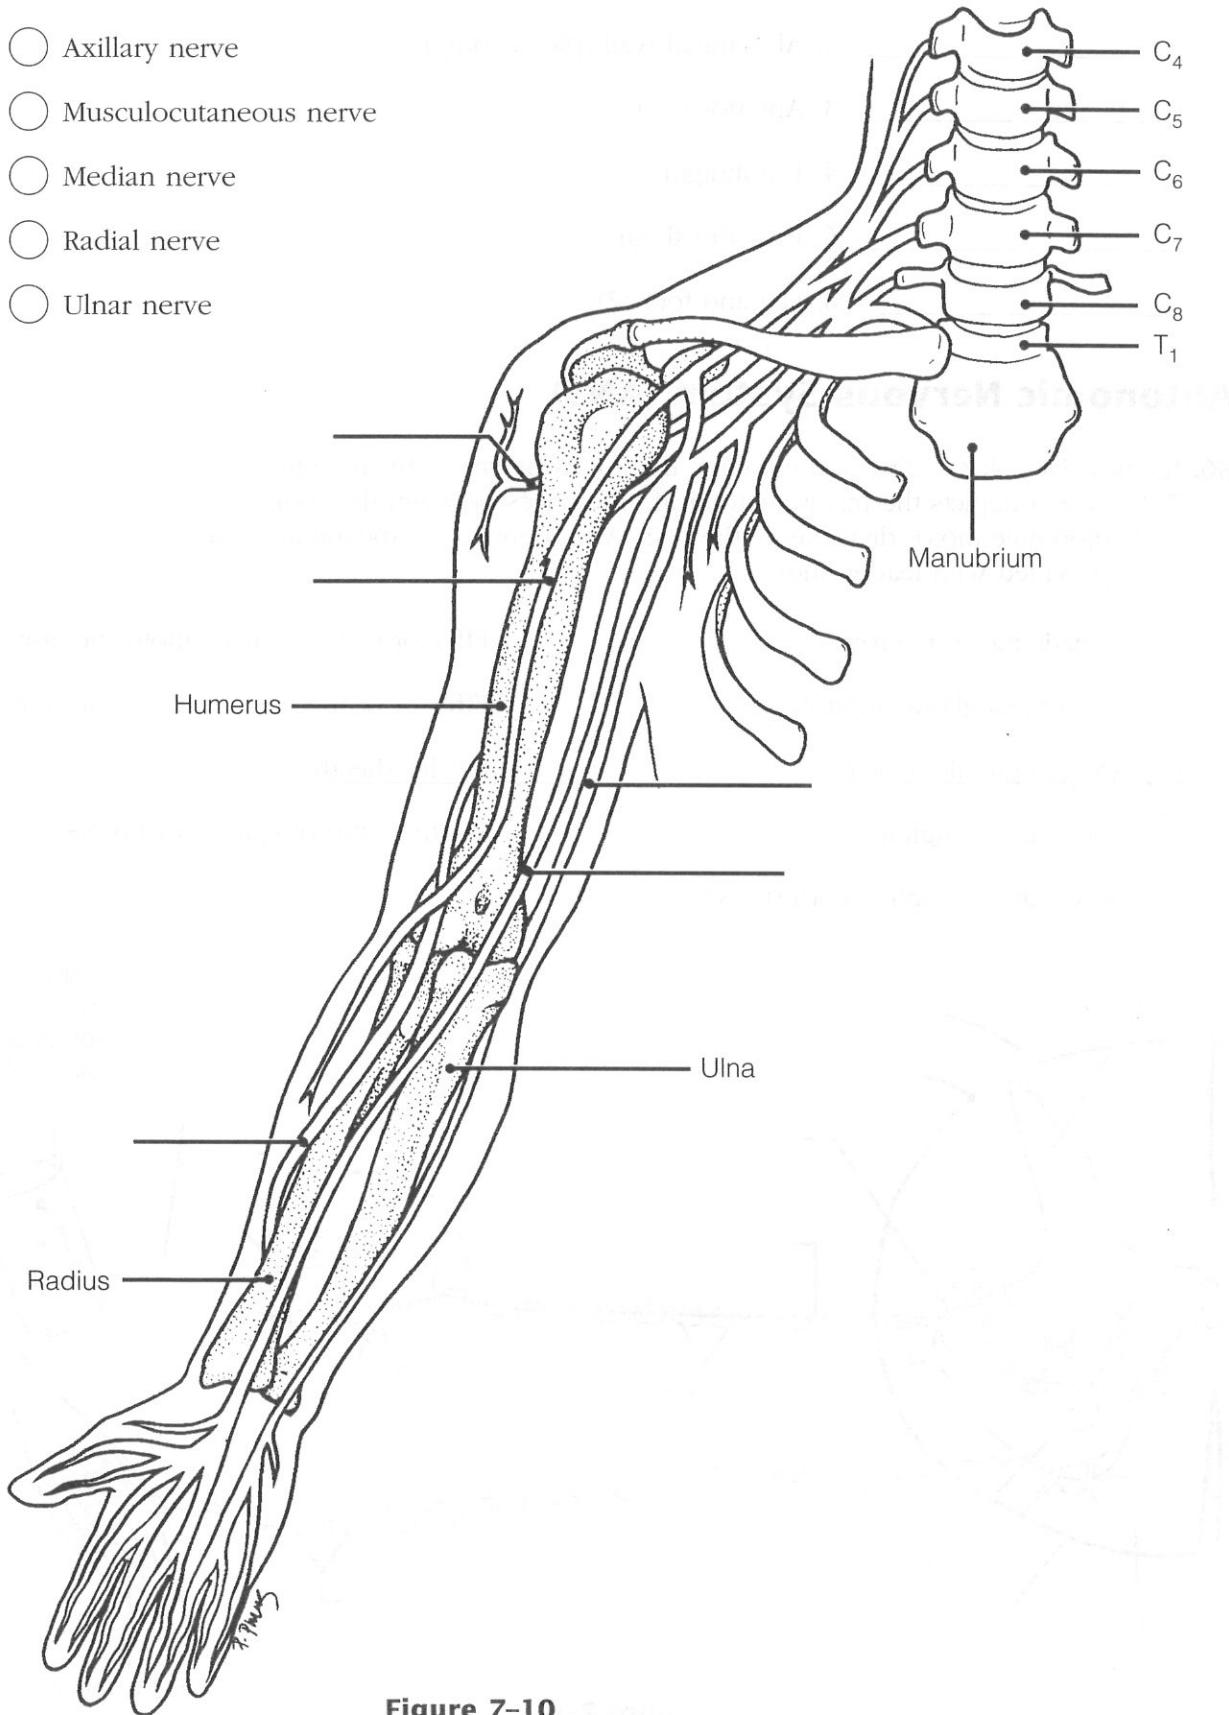

in the answer blanks.

of the following activities, sensations, or disorders. Insert your response  
in each

~~ANSWER BLANKS~~

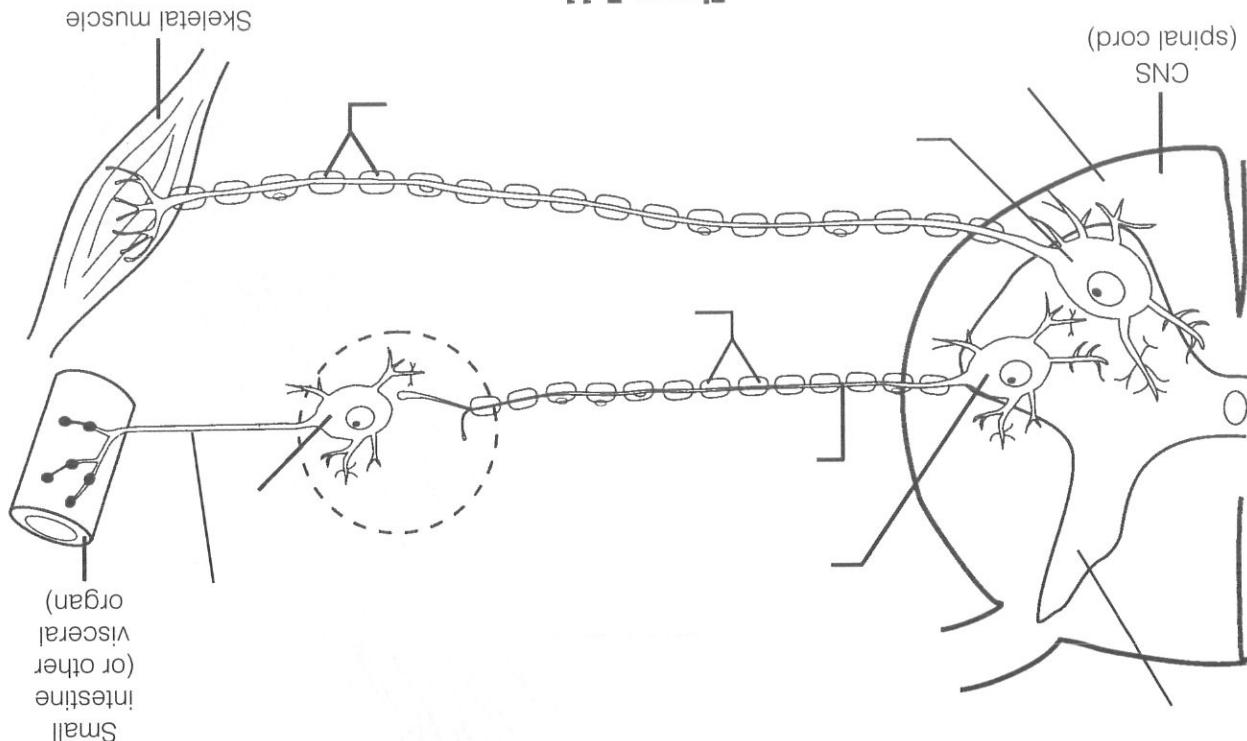

34. Figure 7–10 is an anterior view of the principal nerves arising from the brachial plexus. Select five different colors and color the coding circles and the nerves listed below. Also, label each nerve by inserting its name at the appropriate leader line.

- Axillary nerve
- Musculocutaneous nerve
- Median nerve
- Radial nerve
- Ulnar nerve

**Figure 7–10**

**Figure 7-11**

- Somatic motor neuron
- ANS preganglionic neuron
- ANS postganglionic neuron
- Myelin sheath
- Effectors of the autonomic motor neuron
- ANS preganglionic neuron
- ANS postganglionic neuron
- CNS
- White matter of spinal cord (CNS)
- Gray matter of spinal cord (CNS)
- Small intestine (or other visceral organ)
- Skeletal muscle

36. Identify, by color coding and labeling, the following structures in Figure 7-11, which depicts the major anatomical differences between the somatic and autonomic motor divisions of the PNS. Also identify by labeling all structures provided with leader lines.

## Autonomic Nervous System (ANS)

1. Neck and shoulders (plexus only) \_\_\_\_\_
2. Abdominal wall (plexus only) \_\_\_\_\_
3. Anterior thigh \_\_\_\_\_
4. Diaphragm \_\_\_\_\_
5. Posterior thigh \_\_\_\_\_
6. Leg and foot (2) \_\_\_\_\_

35. Name the major nerves that serve the following body areas. Insert your responses in the answer blanks.

responses in the answer blanks.

37. The following table indicates a number of conditions. Use a check (✓) to show which division of the autonomic nervous system is involved in each condition. Then, respond to the true-to-life situation below the chart.

Condition	Sympathetic	Parasympathetic
1. Postganglionic axons secrete norepinephrine; adrenergic fibers		
2. Postganglionic axons secrete acetylcholine; cholinergic fibers		
3. Long preganglionic axon, short postganglionic axon		
4. Short preganglionic axon, long postganglionic axon		
5. Arises from cranial and sacral nerves		
6. Arises from spinal nerves T <sub>1</sub> to L <sub>3</sub>		
7. Normally in control		
8. Fight-or-flight system		
9. Has more specific control		
10. Causes a dry mouth, dilates bronchioles		
11. Constricts eye pupils, decreases heart rate		

You are alone in your home late in the evening, and you hear an unfamiliar sound in your backyard. In the spaces provided, list four physiologic events promoted by the sympathetic nervous system that would help you to cope with this rather frightening situation.

1. \_\_\_\_\_
2. \_\_\_\_\_
3. \_\_\_\_\_
4. \_\_\_\_\_

stop is the (1).

thigh muscles. "How is that, proprioceptor 1?" From this information, you determine that your first diately, decreasing impulses to the posterior hip muscles and increasing impulses to the anterior. We are beginning to fall backward and will soon lose our balance." The computer responds immediately through the loudspeaker: "The Pelvis is tipping too far posteriorly. Please correct. You begin your journey after being miniaturized and injected into the warm pool of cerebrospinal fluid in your host's fourth ventricle. As you begin your stroll through the nervous tissue, you notice a huge area of branching white matter overheard. As you enter the first computer room you hear an announcement through the loudspeaker: "The Pelvis is tipping too far posteriorly. Please correct.

to determine where you are at any given time during your journey through the nervous system. computerized room where you can observe what occurs in that particular area. Your assignment is that each of the various functional regions of the brain has aenvision strolling through its various regions. Imagine instead nervous tissue is quite densely packed, and it is difficult to

Continuing your journey upward toward the higher brain centers, finally you are certain that you have reached the cerebral cortex. The first center you visit is quiet, like a library with millions of "encyclopedias" of facts and recordings of past input. You conclude that this must be the area where (4) are stored and that you are in the (5) lobe. The next stop is close-by. As you enter the computer center, you once again hear a loudspeaker: "Let's have the motor instructions to say 'tintinnabulation.' Hurry, we don't want them to think we're tongue-tied." This area is obviously (6). Your final stop in the cerebral cortex is a very hectic center. Electrical impulses are traveling back and forth between giant neurons, sometimes in different directions and sometimes back and forth between a small number of neurons. Watching intently, you try to make some sense out of these interactions and suddenly realize that this *is* what is happening here. The neurons *are* trying to make some sense out of something, and this helps you decide that this must be the brain area where (7) occurs in the (8) lobe.

You hurry out of this center and retrace your steps back to the cerebrospinal fluid, deciding en route to observe a cranial nerve. You decide to pick one randomly and follow it to the organ it serves. You climb on to the first cranial nerve you see and slide down past the throat. Picking up speed, you quickly pass the heart and lungs and see the stomach and small intestine coming up fast. A moment later you land on the stomach and now you know that this wandering nerve has to be the (9). As you look upward, you see that the nerve is traveling almost straight up and that you'll have to find an alternative route back to the cerebrospinal fluid. You begin to walk posteriorly until you find a spinal nerve, which you follow until you reach the vertebral column. You squeeze between two adjacent vertebrae to follow the nerve to the spinal cord. With your pocket knife you cut away the tough connective tissue covering the cord. Thinking that the (10) covering deserves its name, you finally manage to cut an opening large enough to get through, and you return to the warm bath of cerebrospinal fluid that it encloses. At this point you are in the (11), and from here you swim upward until you get to the lower brain stem. Once there, it should be an easy task to find the holes leading into the (12) ventricle, where your journey began.

45. Marie Nolin exhibits slow, tentative movements and a very unstable gait. Examination reveals she cannot touch her finger to her nose with eyes closed. What is the name of this condition and what part of her brain is damaged?

46. Which would be the more likely result of injury to the posterior side of the spinal cord only—paralysis or paresthesia (loss of sensory input)? Explain your answer.

47. While jogging in Riverside Park, Susan was confronted by an angry dog. What division of her ANS was activated as she turned tail and ran from the dog?

48. During action potential transmission, many ions cross the neuronal membrane at right angles to the membrane. What is it that travels along the membrane and acts as the signal?

## THE FINALE: MULTIPLE CHOICE

49. Select the best answer or answers from the choices given.

1. Bipolar neurons:
  - A. are found in the head
  - B. are always part of an afferent pathway
  - C. have two dendrites
  - D. have two axons
2. Which of the following skin cells would form a junction with a motor neuron?
  - A. Keratinocyte
  - B. Sudoriferous glandular epithelial cell
  - C. Arrector pili muscle cell
  - D. Fibroblast
3. A synapse between an axon terminal and a neuron cell body is called:
  - A. axodendritic
  - B. axoaxonic
  - C. axosomatic
  - D. axoneuronic
4. Which is an incorrect association of brain region and ventricle?
  - A. Mesencephalon—third ventricle
  - B. Cerebral hemispheres—lateral ventricles
  - C. Pons—fourth ventricle
  - D. Medulla—fourth ventricle
5. The pineal gland is located in the:
  - A. hypophysis cerebri
  - B. mesencephalon
  - C. epithalamus
  - D. corpus callosum
6. Which of the following is not part of the brain stem?
  - A. Medulla
  - B. Cerebellum
  - C. Pons
  - D. Midbrain
7. When neurons in Wernicke's area send impulses to neurons in Broca's area, the white matter tracts utilized are:
  - A. commissural fibers
  - B. projection fibers
  - C. association fibers
  - D. anterior funiculus
8. Functions that are at least partially overseen by the medulla are:
  - A. regulation of the heart
  - B. maintaining equilibrium
  - C. regulation of respiration
  - D. visceral motor function
9. Which structures are directly involved with formation, circulation, and drainage of CSF?
  - A. Ependymal cilia
  - B. Ventricular choroid plexuses
  - C. Arachnoid villi
  - D. Serous layers of the dura mater
10. In an earthquake, which type of sensory receptor is most likely to sound the *first* alarm?
  - A. Exteroceptor
  - B. Visceroceptor
  - C. Mechanoreceptor
  - D. Proprioceptor

- Use the following choices to respond to questions 17–28:
- A. sympathetic division
  - B. parasympathetic division
  - C. both sympathetic and parasympathetic
  - D. neither sympathetic nor parasympathetic
  - E. 17. Typically has long preganglionic and short postganglionic fibers
  - F. 18. Some fibers utilize gray rami communicantes
  - G. 19. Courses through spinal nerves
  - H. 20. Has splanchnic nerves
  - I. 21. Courses through cranial nerves
  - J. 22. Originates in cranial nerves
  - K. 23. Effects enhanced by direct stimulation of a hormonal mechanism
  - L. 24. Includes optic ganglion
  - M. 25. Includes celiac ganglion
  - N. 26. Hypoactivity of this division would lead to decrease in metabolic rate
  - O. 27. Has widespread, long-lasting effects
  - P. 28. Sets the tone for the heart
11. Cranial nerves that have some function in vision include the:
- A. trochlear
  - B. trigeminal
  - C. abducent
  - D. facial
  - E. mandibular division of trigeminal nerve
  - F. to the:
  - G. glossopharyngeal nerve
  - H. vagus nerve
  - I. right trapezius and sternocleidomastoid muscles were atrophied, you would suspect damage to the:
  - J. cervical plexus
  - K. motor branches of the cervical plexus
  - L. accessory nerve
  - M. forearm?
  - N. which one of these nerves?
  - O. median
  - P. ulnar
  - Q. radial
  - R. axillary
12. Eating difficulties would result from damage to the:
- A. trigeminal
  - B. facial nerve
  - C. glossopharyngeal nerve
  - D. vagus nerve
  - E. right trapezius and sternocleidomastoid muscles were atrophied, you would suspect damage to the:
  - F. cervical plexus
  - G. motor branches of the cervical plexus
  - H. ulnar nerve
  - I. radial nerve
  - J. median nerve
  - K. ulnar nerve
  - L. forearm?
  - M. which one of these nerves?
  - N. median
  - O. ulnar
  - P. radial
  - Q. axillary
13. If the right trapezius and sternocleidomastoid muscles were atrophied, you would suspect damage to the:
- A. cervical plexus
  - B. motor branches of the cervical plexus
  - C. ulnar nerve
  - D. median nerve
  - E. radial nerve
  - F. ulnar nerve
  - G. which one of these nerves?
  - H. median
  - I. ulnar
  - J. radial
  - K. axillary
  - L. forearm?
  - M. which one of these nerves?
  - N. ulnar
  - O. radial
  - P. median
  - Q. axillary
14. Which nerve stimulates muscles that flex the forearm?
- A. ulnar
  - B. median
  - C. radial
  - D. musculocutaneous
  - E. which one of these nerves?
  - F. median
  - G. ulnar
  - H. radial
  - I. axillary
  - J. which one of these nerves?
  - K. ulnar
  - L. radial
  - M. median
  - N. which one of these nerves?
  - O. ulnar
  - P. radial
  - Q. axillary
15. Motor functions of arm, forearm, and fingers would be affected by damage to which one of these nerves?
- A. radial
  - B. median
  - C. ulnar
  - D. axillary
  - E. which one of these nerves?
  - F. ulnar
  - G. radial
  - H. median
  - I. axillary
  - J. which one of these nerves?
  - K. ulnar
  - L. radial
  - M. median
  - N. which one of these nerves?
  - O. ulnar
  - P. radial
  - Q. axillary
16. An inability to extend the leg would result from a loss of function of the:
- A. lateral femoral cutaneous nerve
  - B. ilioinguinal nerve
  - C. saphenous branch of femoral nerve
  - D. femoral nerve
