

# 8

# SPECIAL SENSES

The body's sensory receptors react to stimuli or changes occurring both within the body and in the external environment. When triggered, these receptors send nerve impulses along afferent pathways to the brain for interpretation, thus allowing the body to assess and adjust to changing conditions so that homeostasis may be maintained.

The minute receptors of general sensation that react to touch—pressure, pain, temperature changes, and muscle tension—are widely distributed in the body. These are considered in Chapter 7. In contrast, receptors of the special senses—sight, hearing, equilibrium, smell, and taste—tend to be localized and in many cases are quite complex. The structure and function of the special sense organs are the subjects of the student activities in this chapter.

## THE EYE AND VISION

1. Complete the following statements by inserting your responses in the answer blanks.

- \_\_\_\_\_ 1. Attached to the eyes are the (1) muscles that allow us to direct our eyes toward a moving object. The anterior aspect of each eye is protected by the (2), which have eyelashes projecting from their edges. Closely associated with the lashes are oil-secreting glands called (3) that help to lubricate the eyes. Inflammation of the mucosa lining the eyelids and covering the anterior part of the eyeball is called (4).
- \_\_\_\_\_ 2.
- \_\_\_\_\_ 3.
- \_\_\_\_\_ 4.

2. Trace the pathway that the secretion of the lacrimal glands takes from the surface of the eye by assigning a number to each structure. (Note that #1 will be *closest* to the lacrimal gland.)

- |                       |                            |
|-----------------------|----------------------------|
| _____ 1. Lacrimal sac | _____ 3. Nasolacrimal duct |
| _____ 2. Nasal cavity | _____ 4. Lacrimal canals   |

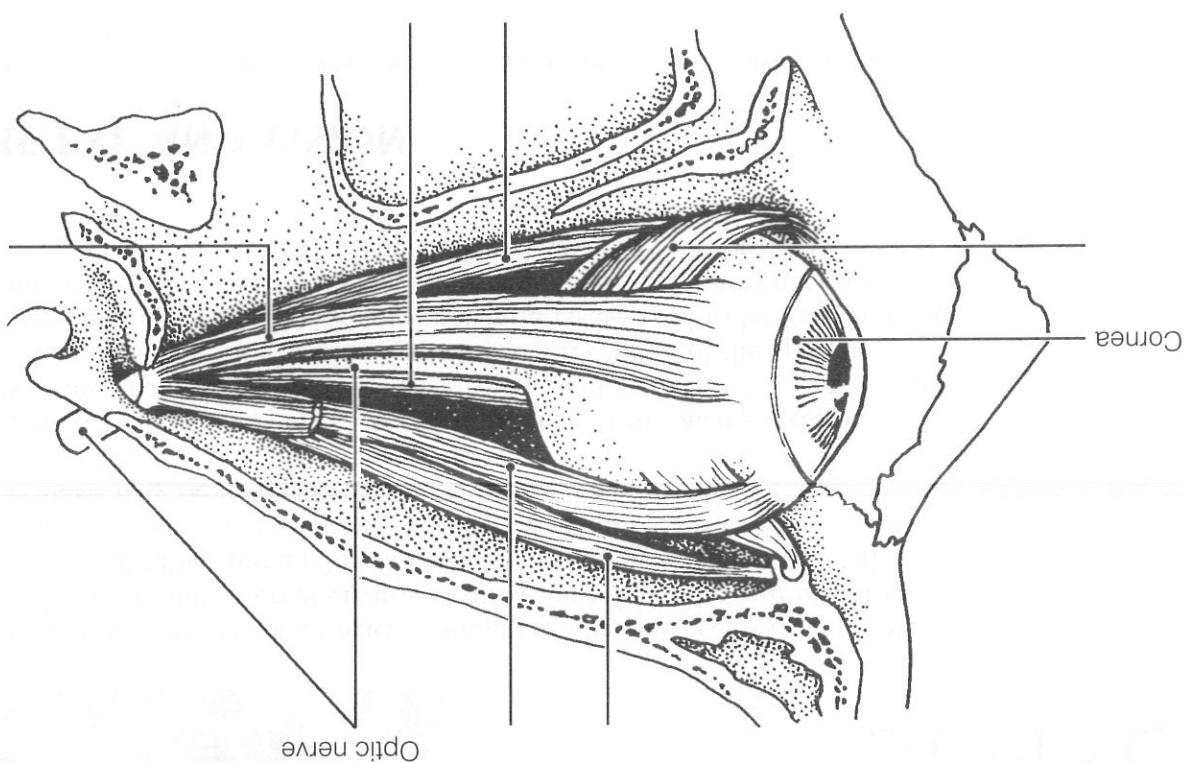

3.

2.

1.

**Accessory eye structures****Secretory product**

4. Three main accessory eye structures contribute to the formation of tears and/or aid in lubricating the eyeball. In the table, name each structure and then name its major secretory product. Indicate which of the secretions has antibacterial properties by circling that response.

**Figure 8-1**

1. Superior rectus \_\_\_\_\_  4. Lateral rectus \_\_\_\_\_   
 2. Inferior rectus \_\_\_\_\_  5. Medial rectus \_\_\_\_\_   
 3. Superior oblique \_\_\_\_\_  6. Inferior oblique \_\_\_\_\_

3. Identify each of the eye muscles indicated by leader lines in Figure 8-1. Color code and color each muscle a different color. Then, in the blanks below, indicate the eye movement caused by each muscle.

5. Match the terms provided in Column B with the appropriate descriptions in Column A. Insert the correct letter response or corresponding term in the answer blanks.

<b>Column A</b>	<b>Column B</b>
_____	1. Light bending
_____	2. Ability to focus for close vision (under 20 feet)
_____	3. Normal vision
_____	4. Inability to focus well on close objects; farsightedness
_____	5. Reflex constriction of pupils when they are exposed to bright light
_____	6. Clouding of the lens, resulting in loss of sight
_____	7. Nearsightedness
_____	8. Blurred vision, resulting from unequal curvatures of the lens or cornea
_____	9. Condition of increasing pressure inside the eye, resulting from blocked drainage of aqueous humor
_____	10. Medial movement of the eyes during focusing on close objects
_____	11. Reflex constriction of the pupils when viewing close objects
_____	12. Inability to see well in the dark; often a result of vitamin A deficiency

6. The intrinsic eye muscles are under the control of which division of the nervous system? Circle the correct response.

1. Autonomic nervous system      2. Somatic nervous system

7. Complete the following statements by inserting your responses in the answer blanks.

1. A (1) lens, like that of the eye, produces an image that is upside down and reversed from left to right. Such an image is called a (2) image. In farsightedness, the light is focused (3) the retina. The lens used to treat farsightedness is a (4) lens. In nearsightedness, the light is focused (5) the retina; it is corrected with a (6) lens.
2. \_\_\_\_\_
3. \_\_\_\_\_
4. \_\_\_\_\_
5. \_\_\_\_\_
6. \_\_\_\_\_

9. Using the key choice terms given in Exercise 8, identify the structures indicated by leader lines on the diagram of the eye in Figure 8-2. Select different colors for all structures provided with a color-coding circle in Exercise 8, and then use them to color the coding circles and corresponding structures in the figure.

19. Pigmented "diaphragm" of the eye \_\_\_\_\_

18. Most anterior part of the sclera—your "window on the world" \_\_\_\_\_

16. \_\_\_\_\_ 17. \_\_\_\_\_

14. \_\_\_\_\_ 15. Refractory media of the eye (#14-17) \_\_\_\_\_

13. Area of acute or discriminatory vision \_\_\_\_\_

eye muscles)

11. \_\_\_\_\_ 12. Smooth muscle structures (intrinsic

10. Heavily pigmented layer that prevents light scattering within the eye \_\_\_\_\_

9. Gel-like substance that helps to reinforce the eyeball \_\_\_\_\_

8. Layer containing the rods and cones \_\_\_\_\_

7. Drains the aqueous humor of the eye \_\_\_\_\_

6. Nutritive (vascular) layer of the eye \_\_\_\_\_

5. Contains muscle that controls the shape of the lens \_\_\_\_\_

4. Area of retina that lacks photoreceptors \_\_\_\_\_

3. The "white" of the eye \_\_\_\_\_

and cornea

2. Fluid in the anterior segment that provides nutrients to the lens \_\_\_\_\_

1. Attaches the lens to the ciliary body \_\_\_\_\_

E.  Ciliary zonule      J.  Optic disk

D.  Ciliary body      I.  Lens

C.  Choroid      H.  Iris

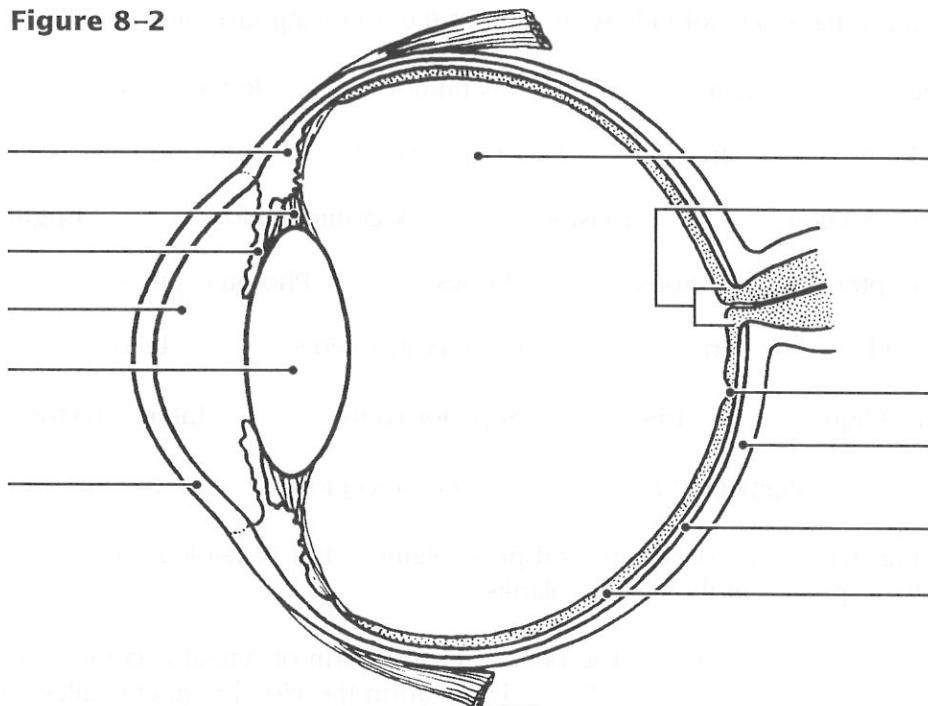

M.  Vitreous humor

B.  Canal of Schlemm      G.  Fovea centralis      L.  Sclera

A.  Aqueous humor      F.  Cornea      K.  Retina

### Key Choices

8. Using the key choices, identify the parts of the eye described in the following statements. Insert the correct term or letter response in the answer blanks.

**Figure 8-2**

- 10.** In the following table, circle the correct word under the vertical headings that describes events occurring within the eye during close and distant vision.

Vision	Ciliary muscle	Lens convexity	Degree of light refraction
1. Distant	Relaxed	Contracted	Increased Decreased
2. Close	Relaxed	Contracted	Increased Decreased

- 11.** Name in sequence the neural elements of the visual pathway, beginning with the retina and ending with the optic cortex.

Retina → \_\_\_\_\_ → \_\_\_\_\_ → \_\_\_\_\_

Synapse in thalamus → \_\_\_\_\_ → Optic cortex

- 12.** Complete the following statements by inserting your responses in the answer blanks.

- \_\_\_\_\_ 1. There are (1) varieties of cones. One type responds most vigorously to (2) light, another to (3) light, and still another to (4) light. The ability to see intermediate colors such as purple results from the fact that more than one cone type is being stimulated (5). Lack of all color receptors results in (6). Because this condition is sex linked, it occurs more commonly in (7). Black and white, or dim light, vision is a function of the (8).
- \_\_\_\_\_ 2. \_\_\_\_\_ 3. \_\_\_\_\_ 4. \_\_\_\_\_ 5. \_\_\_\_\_ 6. \_\_\_\_\_ 7. \_\_\_\_\_ 8.

A. Anvil (incus)	E. External acoustic	I. Pmma	M. Tympanic	C. Cochlea	G. Oval window	K. Semicircular canals	D. Endolymph	H. Perilymph	L. Stirrup (stapes)	J. Round window	F. Hammer (malleus)	B. Pharyngotympanic	N. Vestibule	tube
meatus														
membrane														
meatus														

### Key Choices

15. Using the key choices, select the terms that apply to the following descriptions. Place the correct letter in the answer blanks.

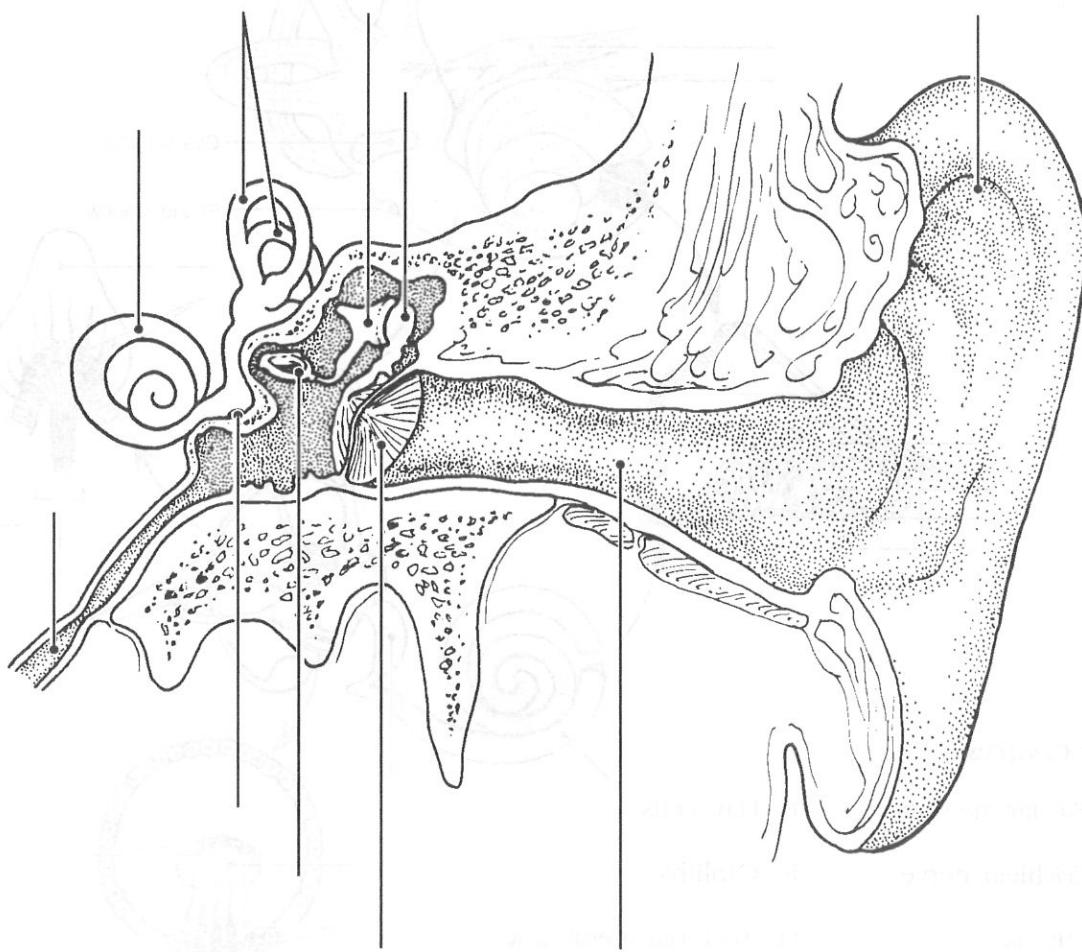

1. The bent or kinked form of retina is combined with a protein called (1) to form the visual pigment called (2). When light strikes the visual pigment, it straightens out and breaks down into its two components. This event is called (3).	2. The retina is composed of protein called (4) and finally becomes (5) as retinal is converted all the way back to vitaminin (6).	3. Because the purple color of the visual pigment changes to (4) and finally becomes (5) as retinal is converted all the way back to vitaminin (6).	4. The external acoustic meatus is the tube that applies to the tympanic membrane.	5. The vestibular canal is the tube that applies to the cochlea.

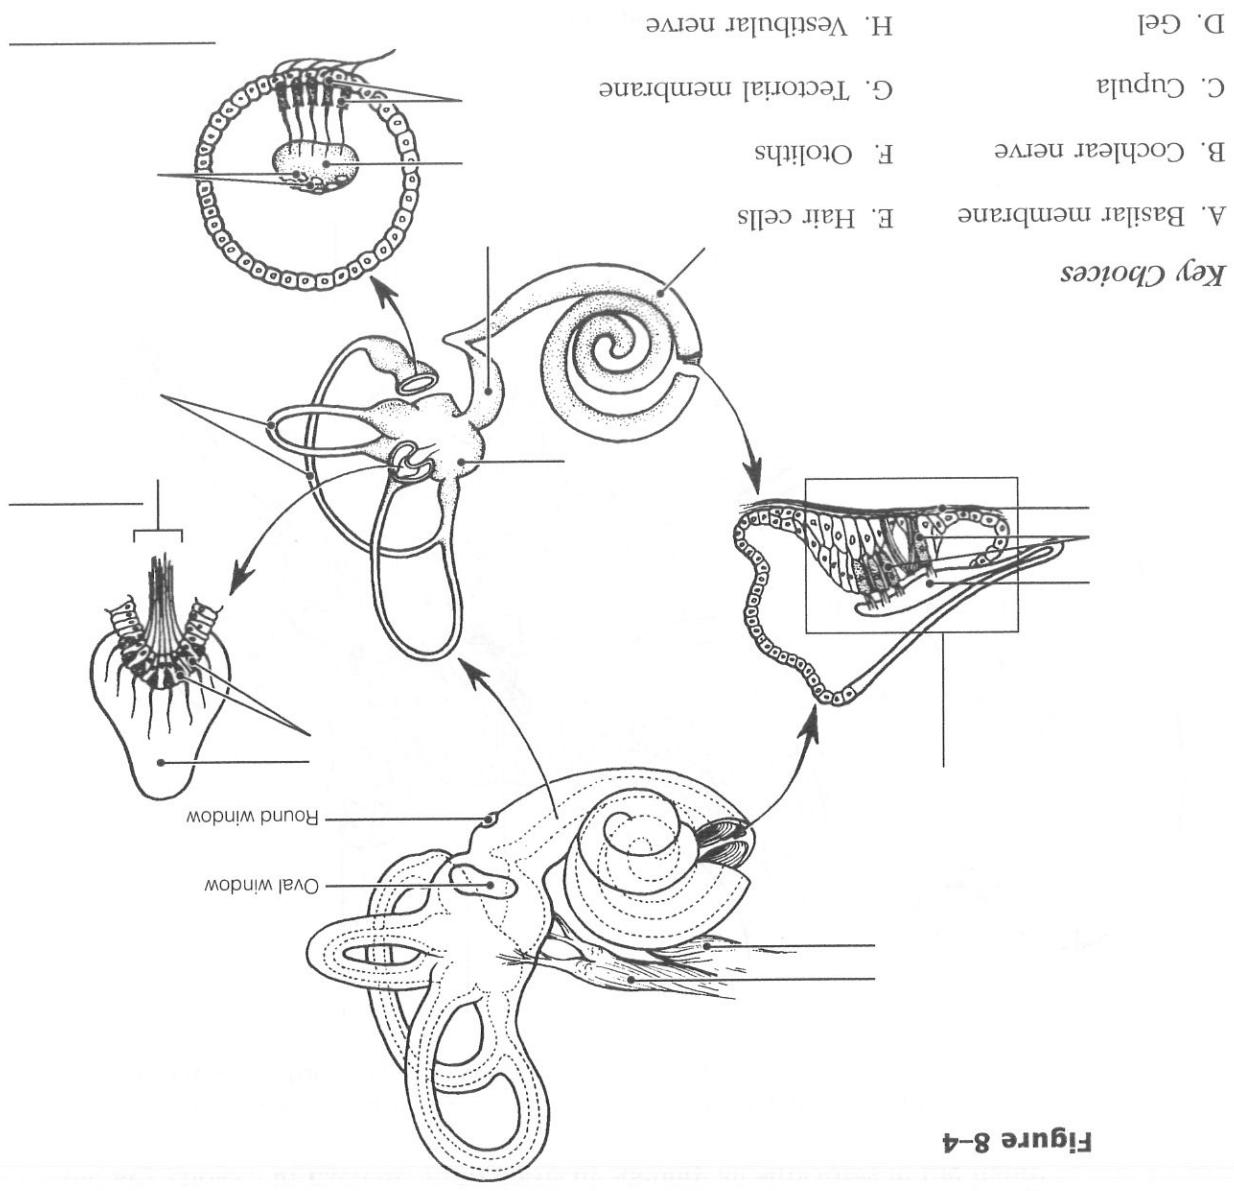

14. Complete the statements concerning rod photopigment and physiology by writing your responses in the answer blanks.

1. Choroid	Sclera	Vitreous humor	Retina	2. Ciliary body	Iris	Superior rectus	Choroid	3. Pupil constriction	Far vision	Accommodation	Bright light

13. Circle the term that does not belong in each of the following groupings.

- \_\_\_\_\_ 12. Allows pressure in the middle ear to be equalized with the atmospheric pressure
- \_\_\_\_\_ 13. Vibrates as sound waves hit it; transmits the vibrations to the ossicles
- \_\_\_\_\_ 14. Contains the organ of Corti
- \_\_\_\_\_ 15. Connects the nasopharynx and the middle ear
- \_\_\_\_\_ 16. \_\_\_\_\_ 17. Contain receptors for the sense of equilibrium
- \_\_\_\_\_ 18. Transmits the vibrations from the stirrup to the fluid in the inner ear
- \_\_\_\_\_ 19. Fluid that bathes the sensory receptors of the inner ear
- \_\_\_\_\_ 20. Fluid contained within the osseous labyrinth, which bathes the membranous labyrinth
- 16.** Figure 8–3 is a diagram of the ear. Use anatomical terms (as needed) from the key choices in Exercise 15 to correctly identify all structures in the figure provided with leader lines. Color all external ear structures yellow; color the ossicles red; color the equilibrium areas of the inner ear green; and color the internal ear structures involved with hearing blue.

**Figure 8–3**

**Figure 8-4**

18. Figure 8-4 is a view of the structures of the membranous labyrinth. Correctly identify the following major areas of the labyrinth on the figure: *semicircular canals, saccule and utricle, and the cochlear duct*. Next, correctly identify each of the receptor types shown in enlarged views (*organ of Corti, cristata ampullaris, and macula*). Finally, using terms from the key choices below, identify all receptor structures provided with leader lines. (Some of these terms may need to be used more than once.)

17. Sound waves hitting the eardrum set it into vibration. Trace the pathway through which vibrations and fluid currents travel to finally stimulate the hair cells in the organ of Corti. Name the appropriate ear structures in their correct sequence and insert your responses in the answer blanks.

- 19.** Complete the following statements on the functioning of the static and dynamic equilibrium receptors by inserting the letter or term from the key choices in the answer blanks.

**Key Choices**

- |                     |                   |                        |
|---------------------|-------------------|------------------------|
| A. Angular/rotatory | E. Gravity        | I. Semicircular canals |
| B. Cupula           | F. Perilymph      | J. Static              |
| C. Dynamic          | G. Proprioception | K. Utricle             |
| D. Endolymph        | H. Saccule        | L. Vision              |

- \_\_\_\_\_ 1. The receptors for (1) equilibrium are found in the crista ampullaris of the (2). These receptors respond to changes in (3) motion. When motion begins, the (4) fluid lags behind and the (5) is bent, which excites the hair cells. When the motion stops suddenly, the fluid flows in the opposite direction and again stimulates the hair cells. The receptors for (6) equilibrium are found in the maculae of the (7) and (8). These receptors report the position of the head in space. Tiny stones found in a gel overlying the hair cells roll in response to the pull of (9). As they roll, the gel moves and tugs on the hair cells, exciting them. Besides the equilibrium receptors of the inner ear, the senses of (10) and (11) are also important in helping to maintain equilibrium.
- \_\_\_\_\_ 2.
- \_\_\_\_\_ 3.
- \_\_\_\_\_ 4.
- \_\_\_\_\_ 5.
- \_\_\_\_\_ 6.
- \_\_\_\_\_ 7.
- \_\_\_\_\_ 8.
- \_\_\_\_\_ 9.
- \_\_\_\_\_ 10.
- \_\_\_\_\_ 11.

- 20.** Indicate whether the following conditions relate to conduction deafness (C) or sensorineural (central) deafness (S). Place the correct letter choice in each answer blank.

- \_\_\_\_\_ 1. Can result from a bug wedged in the external auditory meatus
- \_\_\_\_\_ 2. Can result from damage to the cochlear nerve
- \_\_\_\_\_ 3. Sound is heard in one ear but not in the other, during both bone and air conduction
- \_\_\_\_\_ 4. Often improved by a hearing aid
- \_\_\_\_\_ 5. Can result from otitis media
- \_\_\_\_\_ 6. Can result from otosclerosis, excessive earwax, or a perforated eardrum
- \_\_\_\_\_ 7. Can result from a blood clot in the auditory cortex of the brain

(limbic region), and many odors bring back (18).  
 smell is closely tied to the emotional centres of the brain  
 (or in solution) to excite the taste receptors. The sense of  
 substances with a (17) tongue because foods must be dissolved  
 depends on the sense of (16). It is impossible to taste sub-  
 stances that much of what is considered taste actually  
 indicates are congested, the sense of taste is decreased. This  
 passages are more contact with the receptors. The  
 to be those that respond to (15) substances. When nasal  
(13), and (14). The most protective receptors are thought  
 The five basic taste sensations are (10), (11), (12),  
 which are located on the sides of (8) or (9) papilla.  
 for taste are found in clusterlike areas called (7), most of  
 brings more air into contact with the receptors. The receptors  
 sages; the act of (6) increases the sensation because it  
 receptors for smell are located in the (5) of the nasal pas-  
 the sense of smell are transmitted by the (4) nerve. The  
 sense of taste are the (1), (2), and (3). Impulses for  
 three cranial nerves involved in transmitting impulses for the
